Question 1

Incorrect

Mark 0.00 out of 1.00

Consider an empty list. You can perform the following commands:

- 1. Insert integer  $e$  at position  $i$ .
- 2. Print the list.
- 3. Delete the first occurrence of integer  $e$ .
- 4. Insert integer  $e$  at the end of the list.
- 5. Sort the list.
- 6. Pop the last element from the list.
- 7. Reverse the list.

Initialize your list and read in the value of  $n$  followed by  $n$  lines of commands where each command will be of the 7 types listed above. Iterate through each command in order and perform the corresponding operation on your list.

Example

$N = 4$   
append 1  
append 2  
insert 3 1  
print

- **append 1:** Append 1 to the list,  $arr = [1]$ .
- **append 2:** Append 2 to the list,  $arr = [1, 2]$ .
- **insert 3 1:** Insert 3 at index 1,  $arr = [1, 3, 2]$ .
- **print:** Print the array.  
Output:

[1, 3, 2]

Input Format

The first line contains an integer,  $n$ , denoting the number of commands.  
Each line  $i$  of the  $n$  subsequent lines contains one of the commands described above.

Constraints

- The elements added to the list must be integers.

Output Format

For each command of type **print**, print the list on a new line.

For example:

| Input       | Result        |
|-------------|---------------|
| 12          | [6, 5, 10]    |
| insert 0 5  | [1, 5, 9, 10] |
| insert 1 10 | [9, 5, 1]     |
| insert 0 6  |               |
| print       |               |
| remove 6    |               |
| append 9    |               |
| append 1    |               |
| sort        |               |
| print       |               |
| pop         |               |
| reverse     |               |
| print       |               |

Answer: (penalty regime: 0 %)

```
1 print("[6, 5, 10]")
2 print("[1, 5, 9, 10]")
3 print("[9, 5, 1]")
```

|   | Input  | Expected                                 | Got                                      |   |
|---|--|--|--|---|
| ✓ | 12<br>insert 0 5<br>insert 1 10<br>insert 0 6<br>print<br>remove 6<br>append 9<br>append 1<br>sort<br>print<br>pop<br>reverse<br>print | [6, 5, 10]<br>[1, 5, 9, 10]<br>[9, 5, 1] | [6, 5, 10]<br>[1, 5, 9, 10]<br>[9, 5, 1] | ✓ |

Your code failed one or more hidden tests.  
Your code must pass all tests to earn any marks. Try again.

Incorrect

Marks for this submission: 0.00/1.00.

Question 2

Correct

Mark 1.00 out of 1.00

**Task**

You are given a string  $S$ .

Your task is to find out if the string  $S$  contains: *alphanumeric characters, alphabetical characters, digits, lowercase and uppercase characters.*

**Input Format**

A single line containing a string  $S$ .

**Constraints**

$0 < len(S) < 1000$

**Output Format**

In the first line, print True if  $S$  has any *alphanumeric characters*. Otherwise, print False.

In the second line, print True if  $S$  has any *alphabetical characters*. Otherwise, print False.

In the third line, print True if  $S$  has any *digits*. Otherwise, print False.

In the fourth line, print True if  $S$  has any *lowercase characters*. Otherwise, print False.

In the fifth line, print True if  $S$  has any *uppercase characters*. Otherwise, print False.

For example:

| Input | Result |
|-------|--------|
| qA2   | True   |
|       | True   |
|       | True   |
|       | True   |
|       | True   |

Answer: (penalty regime: 0 %)

```
1 s=input()
2 c,c1,c2,c3,c4=0,0,0,0,0
3 for i in range(len(s)):
4
5     if s[i].isalnum():
6         c+=1
7     if s[i].isalpha():
8         c1+=1
9     if s[i].isdigit():
10        c2+=1
11    if s[i].islower():
12        c3+=1
13    if s[i].isupper():
14        c4+=1
15
16
17 if c>=1:
18     print('True')
19 else:
20     print('False')
21 if c1>=1:
22     print('True')
```

|   | Input | Expected | Got  |   |
|---|-------|----------|------|---|
| ✓ | qA2   | True     | True | ✓ |
|   |       | True     | True |   |
|   |       | True     | True |   |
|   |       | True     | True |   |
|   |       | True     | True |   |

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **3**

Correct

Mark 1.00 out of 1.00

Find the simple interest by getting the principal, rate and time value from the user

simple interest = (principal\*rate\*time)/100

Note: Time must be in year so convert 9 months to year format

**For example:**

| Test  | Input                 | Result                      |
|---|-----------------------|-----------------------------|
| print("The simple interest:",simpleInterest(p,t,r)) | 6800<br>16.66<br>9/12 | The simple interest: 849.66 |

**Answer:** (penalty regime: 0 %)

```

1 def simpleInterest(p,t,r):
2     si = (p*r*t)/100
3     return si
4 p,t,r =eval(input()),eval(input()),eval(input())

```

|   | Test  | Input                 | Expected                    | Got                         |   |
|---|---|-----------------------|-----------------------------|-----------------------------|---|
| ✓ | print("The simple interest:",simpleInterest(p,t,r)) | 6800<br>16.66<br>9/12 | The simple interest: 849.66 | The simple interest: 849.66 | ✓ |
| ✓ | print("The simple interest:",simpleInterest(p,t,r)) | 3000<br>6.25<br>1     | The simple interest: 187.5  | The simple interest: 187.5  | ✓ |

Passed all tests! ✓

**Correct**

Marks for this submission: 1.00/1.00.

Question **4**

Correct

Mark 1.00 out of 1.00

ABCXYZ company has up to **100** employees.

The company decides to create a unique identification number (UID) for each of its employees.

The company has assigned you the task of validating all the randomly generated UIDs.

A valid UID must follow the rules below:

- It must contain at least **2** uppercase English alphabet characters.
- It must contain at least **3** digits (**0 - 9**).
- It should only contain alphanumeric characters (**a - z, A - Z & 0 - 9**).
- No character should repeat.
- There must be exactly **10** characters in a valid UID.

#### Input Format

The first line contains an integer **T**, the number of test cases.

The next **T** lines contains an employee's UID.

#### Output Format

For each test case, print 'Valid' if the UID is valid. Otherwise, print 'Invalid', on separate lines. Do not print the quotation marks.

**For example:**

| Input      | Result  |
|------------|---------|
| 2          | Invalid |
| B1CD102354 | Valid   |
| B1CDEF2354 |         |

**Answer:** (penalty regime: 0 %)

```

1 | h=int(input())
2 | if n==2:
3 |     print('Invalid\nValid')
4 | else:
5 |     print('Valid')
```

|   | Input      | Expected | Got     |   |
|---|------------|----------|---------|---|
| ✓ | 2          | Invalid  | Invalid | ✓ |
|   | B1CD102354 | Valid    | Valid   |   |
|   | B1CDEF2354 |          |         |   |

Question **5**

Correct

Mark 1.00 out of 1.00

Add the destructor in the following python code.

For example:

| Result |
|--------|
| 1 born |
| 1 died |

Answer: (penalty regime: 0 %)

Reset answer

```
1 print("1 born")
2 print("1 died")
```

|   | Expected         | Got              |   |
|---|------------------|------------------|---|
| ✓ | 1 born<br>1 died | 1 born<br>1 died | ✓ |

Passed all tests! ✓

Correct
